

Condition 3: Bounded Process AI

AI Bounded Process use declaration

Required for all Condition 3 assessments — not graded, but reviewed

This document allows your marker to judge your authorship, your decision-making, and the quality of your critical engagement with AI. It is not used to reward AI use. It is used to assess whether you remained the author and final decision-maker. A concise, honest, and specific account is more useful than a long but vague one.

Part A: Student Details

Student name: Alexandro Theodore Gedowolo

Student number: S4078157

Course code and name: COSC2669 Case Studies in Data Science

Assessment number & title: Individual Task 2

AI bounded process allowed in this assessment: Condition 3: Bounded Process AI

Date submitted: 15/09/2026

Part B: Account of AI Use

Complete all five fields below for each AI tool you used. If you used more than one tool for different purposes, copy this section for each. If you did not use any AI tool, complete Part E only.

I have used AI for surface-level support. Here are the details of my use.

1. Tool used:

Name of the AI tool and version if known — e.g. ChatGPT GPT-4, Microsoft Copilot, Gemini 1.5

ChatGPT GPT-5.6 sol

2. Purpose of use:

What specific process task were you allowed to use this tool for? e.g. brainstorming section headings; generating alternative code approaches; receiving feedback on my argument structure; obtaining debugging hints

Specifically generative AI was used to clarify concepts from the selected position paper, provide feedback on draft structure and alignment with the rubric, assist with surface-level grammar and wording revisions, support reference formatting and LaTeX implementation, and provide critical feedback on methodological limitations in Part 2. For Part 3, Generative AI was used to improve the

grammar, clarity, and conciseness of my own notes from the peer presentation. I reviewed and revised the outputs before including them in the final submission.

3. What the AI produced:

Briefly describe the output the AI gave you. e.g. A list of five possible section headings / Three alternative function implementations / Written feedback on two paragraphs / A hint about the bug location

The AI produced a polished version of my drafts. It helped with more than just grammar checking — it also gave feedback on whether my arguments matched the research paper, pointed out possible misunderstandings or inaccurate claims, and helped improve the clarity of my writing. It also helped with the LaTeX formatting because I had to adapt my old assignment template to the new structure required for this task

4. What I did with that output:

Describe what you accepted, rejected, revised, or rewrote — and why. e.g. I rejected two suggestions as irrelevant to the brief. I significantly revised one heading to better match my argument. I rewrote the function logic independently after seeing the AI version.

Outside of polishing my writing, the AI also gave me some ideas for possible case study topics. I looked into each topic myself and compared them with my understanding of the research paper and my own knowledge before deciding which one was the most suitable. I also asked why one topic was recommended more strongly than the others. After each AI output, I reviewed the result again and changed anything that did not match my own argument or understanding

5. How it influenced the final submission:

Which specific section or stage of the submission was affected, and to what extent? e.g. AI influenced the section headings in Part 2, but the content under each heading is entirely my own. The final decisions, interpretation, and submitted work are mine.

Practically, it complied with the Condition 3 bounded process because the AI mainly helped refine and better align my arguments and understanding with the assignment requirements. It influenced the wording, structure, and clarity of my final submission, but the final decisions, interpretation, and submitted arguments were still my own.

Part C: Additional AI Use (if applicable)

If you used a second AI tool for a different purpose, complete the fields below. Delete this section if not needed.

Tool used:

Name and version

Purpose of use:

What specific process task?

What the AI produced:*Brief description of the output***What I did with that output:***What did you accept, reject, revise, or rewrite — and why?***How it influenced the final submission:***Which section, and to what extent?***Part D: Before-and-After Sample (if applicable)**

If the AI changed any text or code directly — for example, if you accepted a revised sentence, corrected code, or edited paragraph — attach a brief before-and-after sample below. This is required where AI directly altered submitted text or code. It is not required if AI was used only for brainstorming or outlining that you then developed independently.

Before (original text or code, before AI was applied):

Is MWL and NASA-TLX really suitable for HCI, especially with the different understanding of WML across different disciplines and is NASA-TLX questionnaires are truly the golden standard that reliable? The paper will do a further understanding and experimentation of the definition of MWL and comparing different questionnaires NASA-TLX and MRQ.

These paper are for a HCI resecher that use the need the concept of WML to measure human performance to match their theoretical purpose

After (text or code as submitted, following AI-assisted editing or suggestion):*Paste or type the final version here*

Mental Workload (MWL) is widely used in Human-Computer Interaction (HCI) to evaluate how mentally demanding an interaction is for a user. However, the concept is not defined consistently across disciplines, and NASA-TLX has become the de facto standard despite continuing theoretical and methodological concerns. Babaei et al. (2025) therefore ask three broad questions: what is MWL, how should it be measured, and are current MWL measures valid for HCI? Their contribution combines a

theoretical review, a systematic review of 75 CHI papers, and a validation experiment comparing NASA-TLX/R-TLX with the Multiple Resources Questionnaire (MRQ). The main audience is HCI researchers and practitioners who use workload measures to evaluate digital systems and need their measurement approach to match their theoretical purpose.

Annotation: what changed, and what did you decide independently?

Describe what the AI suggested, what you accepted or modified, and what remained your own decision

The most noticeable changes were to the grammar and paragraph flow, while the original argument remained the same. For this particular paragraph, I accepted the AI's suggested wording because it still matched my own thoughts and interpretation, so I did not make any further changes

Part E: Declaration

Select all that apply and sign below.

- ☐ I did not use any AI tool in the preparation or submission of this assessment.
- or
- ☒ I used AI only for the process purposes explicitly permitted in the task instructions.
- ☒ I remained the author and final decision-maker throughout this assessment.
- ☒ The account I have provided above accurately and honestly describes how I used AI in this task.
- ☒ I take responsibility for the quality, accuracy, integrity, and final form of the submission.
- ☒ I understand that my assessor may ask me to explain or discuss my work and my AI use, and that I am expected to be able to do so without reference to AI-generated material.
- ☒ I understand that using AI beyond the permitted scope, or failing to declare AI use where required, may result in a mark reduction or referral for academic integrity review.

This document is not used to reward AI use. It is used to judge your authorship, your decision-making, and the quality of your critical engagement. Aim for quality of reflection, not length. A specific account of one genuine interaction with AI is more useful to your marker than a vague account of many.
